THE DARK SKY PARADOX

By: Ricardo Pires Correa Franco.

I saw a video talking about the dark sky and there was a lot of nonsense, but he said the obvious: a small value multiplied by infinite value results in an infinite value.

There is no perfect vacuum, there is something small that, at a distance of infinite value, results in a barrier of infinite value that light cannot pass (like a wall).

So, each small thing slows down the light a little until it makes the light stop, so the speed of light is not a constant.

As We Wanted To Demonstrate.
